

<div>DEFINITION</div> <div>Subset</div>	<div>Notation: $A \subseteq B$, informally $A \subset B$</div> <div>if $x \in A$, then $x \in B$</div>
<div>DEFINITION</div> <div>Proper Subet</div>	<div>Notation: $A \subset B$</div> <div>$A \subseteq B$ and $A \neq B$</div>
<div>DEFINITION</div> <div>Union</div>	<div>Notation: $A \cup B$</div> <div>$\{x \mid x \in A \text{ or } x \in B\}$</div>
<div>DEFINITION</div> <div>Intersection</div>	<div>Notation: $A \cap B$</div> <div>$\{x \mid x \in A \text{ and } x \in B\}$</div>

<div>DEFINITION</div> <div>Disjoint Sets</div>	<div>A and B are disjoint if $A \cap B = \emptyset$</div>
<div>DEFINITION</div> <div>Equal Sets</div>	<div>A and B are equivalent if $A \subset B$ and $B \subset A$</div>
<div>DEFINITION</div> <div>Complement</div>	<div>For any set $A \subset U$</div> <div>$A' = \{x \in U \mid x \notin A\}$</div>
<div>DEFINITION</div> <div>Difference</div>	<div>$A \setminus B = A \cap B'$</div>

<div>DEFINITION</div> <div>Cartesian Product</div>	<div> $A \times B = \{(a, b) \mid a \in A \text{ and } b \in B\}$ </div>
<div>DEFINITION</div> <div>Relation</div>	<div> <p>A relation from A to B is a subset of $A \times B$</p> </div>
<div>DEFINITION</div> <div>Function or Map</div>	<div> <p>Notation: $f : A \rightarrow B$, where A is the <i>domain</i> and B is the <i>target</i></p> <p>A relation from A to B where $\forall a \in A, \exists! (a, b)$</p> <p>$f(a) = b$ means $(a, b) \in f$</p> </div>
<div>DEFINITION</div> <div>Image of Function</div>	<div> $f(A) = \{f(a) : a \in A\}$ <p>Note: $f(A) \subset B$</p> </div>

<div>DEFINITION</div> <div> <i>Surjective</i> </div>	<div>Also known as <i>onto</i></div> <div>A function $f : A \rightarrow B$ for which $f(A) = B$</div>
<div>DEFINITION</div> <div> <i>Injective</i> </div>	<div>Also known as <i>one-to-one</i></div> <div>A function $f : A \rightarrow B$ for which $f(a_1) = f(a_2)$ implies $a_1 = a_2$</div>
<div>DEFINITION</div> <div> <i>Bijjective</i> </div>	<div>A function which is both injective and surjective.</div>
<div>DEFINITION</div> <div> <i>Composition</i> </div>	<div>For $f : A \rightarrow B$ and $g : B \rightarrow C$, the composition $g \circ f$ is defined as:</div> <div>$(g \circ f)(x) = g(f(x))$</div> <div>Notes: $g \circ f : A \rightarrow C$, and composition is associative</div>

<div>DEFINITION</div> <div>Composition Properties</div>	<ul style="list-style-type: none"> • If g and f are surjective, $g \circ f$ is surjective • If g and f are injective, $g \circ f$ is injective • If g and f are bijective, $g \circ f$ is bijective
<div>DEFINITION</div> <div>Identity Map</div>	<div>Notation: id_s</div> <div>$id(x) = x, id : S \rightarrow S$</div> <div>Note: $id_s = \{(x, x) : x \in S\}$</div>
<div>DEFINITION</div> <div>Inverse</div>	<div>Notation: f^{-1}</div> <div>$g = f^{-1} \iff g \circ f = id_A$</div> <div>$f$ is invertible means it has an inverse.</div> <div>f is invertible iff it's bijective.</div>
<div>DEFINITION</div> <div>Partition</div>	<div>Let X be a set. P is a partition of X means:</div> <div>$P = \{p_i \subset X \mid P \neq \emptyset\}$, all p_i are disjoint, and the union of all p_i is P.</div>

<div>DEFINITION</div> <div> <div></div> <div> <div>Equivalence Relation</div> </div> </div>	<div> <div>Relation R of X with these properties:</div> <ul style="list-style-type: none"> Reflexive: $\forall x \in X, (x, x) \in R$ Symmetric: $(x, y) \in R \implies (y, x) \in R$ Transitive: $(x, y), (y, z) \in R \implies (x, z) \in R$ <div>$x \sim y$ means $(x, y) \in R$</div> </div>
<div>DEFINITION</div> <div> <div></div> <div> <div>Equivalence Class</div> </div> </div>	<div> <div>$[x] = \{y \in X \mid y \sim x\}$</div> <div>Two equivalence classes are either disjoint or equal.</div> </div>
<div>DEFINITION</div> <div> <div></div> <div> <div>Divisibility</div> </div> </div>	<div> <div>Notation: $b \mid a$ (b divides a)</div> <div>$a = bk$ for some $k \in \mathbb{Z}$</div> </div>
<div>DEFINITION</div> <div> <div></div> <div> <div>Congruence</div> </div> </div>	<div> <div>Let $r, s \in \mathbb{Z}$ and $n \in \mathbb{N}$.</div> <div>Notation: $r \equiv_n s$</div> <div>$n \mid (r - s)$</div> <div>Note: \equiv_n is an equivalence relation of \mathbb{Z}</div> </div>

<div>DEFINITION</div> <div>Properties of Congruence</div>	<ul style="list-style-type: none"> • $a + b \equiv b + a \quad ab \equiv ba$ • $(a + b) + c \equiv a + (b + c) \quad (ab)c \equiv a(bc)$ • $a + 0 \equiv a \quad a1 \equiv a$ • Multiplication distributes over addition • $\exists b \in \mathbb{Z} \mid a + b \equiv 0$ • Let $a \in \mathbb{Z}, a \neq 0$ $\gcd(a, n) = 1 \iff \exists b \in \mathbb{Z} \mid ab \equiv_n 1$
<div>DEFINITION</div> <div>Mathematical Induction</div>	<div>Let $S(n)$ be a statement about $n \in \mathbb{N}$</div> <div>If $S(n_0)$ is true for some $n_0 \in \mathbb{N}$, and $S(k) \implies S(k + 1)$, then $S(n)$ is true for all $n \geq n_0$</div>
<div>DEFINITION</div> <div>Strong Mathematical Induction</div>	<div>Let $S(n)$ be a statement about $n \in \mathbb{N}$</div> <div>If $S(n_0)$ is true for some $n_0 \in \mathbb{N}$, and $S(n_0), S(n_0 + 1), S(n_0 + 2) \dots S(k) \implies S(k + 1)$, then $S(n)$ is true for all $n \geq n_0$</div>
<div>DEFINITION</div> <div>Well-Ordered</div>	<div>A non-empty subset of \mathbb{Z} which contains a least element.</div>

<div>DEFINITION</div> <div>Well-Ordering Principle</div>	<div>Every non-empty subset of \mathbb{N} is well-ordered.</div>
<div>DEFINITION</div> <div>Division Algorithm</div>	<div>Let $a, b \in \mathbb{Z}$ and $b > 0$</div> <div>$\exists! q, r \in \mathbb{Z} \mid a = qb + r \text{ and } 0 \leq r < b$</div>
<div>DEFINITION</div> <div>Common Divisor</div>	<div>Let $a, b, d \in \mathbb{Z}$</div> <div>d is a common divisor of a and b means that $d \mid a$ and $d \mid b$</div>
<div>DEFINITION</div> <div>Greatest Common Divisor</div>	<div>Notation: $\gcd(a, b)$ where $a, b \in \mathbb{Z}$</div> <div>Note: If $a, b > 0$, $\exists r, s \in \mathbb{Z} \mid \gcd(a, b) = ar + bs$</div>

<div>DEFINITION</div> <div>Relatively Prime</div>	<div>$\gcd(a,b) = 1$</div>
<div>DEFINITION</div> <div>Prime</div>	<div> <p>p is prime if only numbers that divide it are 1 and p</p> <p>Otherwise, p is <i>composite</i></p> </div>
<div>DEFINITION</div> <div>Prime Number Properties</div>	<div> $p \mid ab \implies p \mid a \text{ or } p \mid b$ <p>There exists an infinite number of primes.</p> </div>
<div>DEFINITION</div> <div>Fundamental Theorem of Arithmetic</div>	<div> <p>Let $n \in \mathbb{N}, n > 1$</p> <p>$n = p_1 p_2 p_3 \dots p_k$ where p_i are prime</p> <p>This factorization is unique.</p> </div>

<div>DEFINITION</div> <div>Binary Operation</div>	<div>A function $f : S \times S \rightarrow S$ on a set S</div> <div>$f(a, b)$ is denoted by $a \circ b$ or ab</div>
<div>DEFINITION</div> <div>Group</div>	<div>Notation: (S, \circ) for operation \circ on set S</div> <div>Properties:</div> <div> <ul style="list-style-type: none"> Associative: $(ab)c = a(bc)$ Identity Exists: $\exists e \in S \mid ai = a = ia, \forall a \in S$ Inverses Exist: $\forall a \in S, \exists b \in S \mid ab = e = be$ </div>
<div>DEFINITION</div> <div>Group Properties</div>	<div>The inverses are unique for each element.</div> <div>$(ab)^{-1} = a^{-1}b^{-1}$</div>
<div>DEFINITION</div> <div>Commutative/Abelian Group</div>	<div>A group for which $ab = ba \ \forall a, b \in S$</div>

<div>DEFINITION</div> <div>Finite Group</div>	<div> (G, \circ) is a finite group if G is a finite set. </div> <div>Otherwise, it's an infinite group.</div>
<div>DEFINITION</div> <div>Group Order</div>	<div> The order of finite group (G, \circ) is G. </div> <div>The order of an infinite group is ∞.</div>
<div>DEFINITION</div> <div>Quaternion Group</div>	<div> (Q_8, \circ) where $Q_8 = \{\pm 1, \pm i, \pm j, \pm k\}$ and: </div> <div> <ul style="list-style-type: none"> $i^2 = j^2 = k^2 = -1$ 1 is identity -1 commutes everything $ij = k, jk = i, ki = j$ $ik = -j, kj = -i, ji = -k$ </div>
<div>DEFINITION</div> <div>Matrix Group</div>	<div> $M_2(\mathbb{R})$ is multiplicative group for all 2x2 real number matrices. </div> <div>Non-abelian group.</div>

<div>DEFINITION</div> <div>General Linear Group</div>	<div>$GL_2(\mathbb{R})$ is subset of $M_2(\mathbb{R})$ where every matrix is invertible.</div> <div>Non-abelian group.</div>
<div>DEFINITION</div> <div>Multiplicative Group Exponents</div>	<div> <ul style="list-style-type: none"> $g^n = g \circ g \circ g \circ g \cdots \mid n \geq 1$ $g^0 = e$ $g^{-1} = g^{-1} \circ g^{-1} \circ g^{-1} \cdots \mid n < 0$ $g^m g^n = g^{m+n}, (g^m)^n = g^{mn}$ $(gh)^n = (h^{-1} g^{-1})^{-n}$ If group is abelian, then $(gh)^n = g^n h^n$ </div>
<div>DEFINITION</div> <div>Additive Group Exponents</div>	<div> <ul style="list-style-type: none"> $ng = g + g + g \cdots \mid n \geq 0$ $-ng = -g + -g + -g \cdots \mid n < 0$ </div> <div>If group is abelian, then $m(g + h) = mg + mh$</div>
<div>DEFINITION</div> <div>Group Cancellation Laws</div>	<div>If G is a group, and $a, b, c \in G$, then:</div> <div>$ba = bc \implies a = c$ (left cancellation)</div> <div>$ab = cb \implies a = c$ (right cancellation)</div>

<div>DEFINITION</div> <div>Subgroup</div>	<div> <p>A group (H, \circ) is a subgroup of (G, \circ) if $H \subseteq G$ and if H also forms a group under the operation \circ. This is true iff:</p> <ul style="list-style-type: none"> Identity $e \in G$ is in H $h_1, h_2 \in H \implies h_1 \circ h_2 \in H$ $h_1 \in H \implies h_1^{-1} \in H$ </div>
<div>DEFINITION</div> <div>Subgroup Alternative Criteria</div>	<div> <p>Let $H \subseteq G$. H is a subgroup of G iff:</p> <ul style="list-style-type: none"> $H \neq \emptyset$ $a, b \in H \implies a \circ b^{-1} \in H$ </div>
<div>DEFINITION</div> <div>Trivial Subgroup</div>	<div> $\{e\}$ </div>
<div>DEFINITION</div> <div>Proper Subgroup</div>	<div> <p>H is a proper subgroup of G if H is a subgroup, and $H \subset G$</p> </div>

<div data-bbox="118 87 255 114" data-label="Text"><p>DEFINITION</p></div> <div data-bbox="266 262 529 302" data-label="Text"><p><i>Proper Subgroup</i></p></div>	<div data-bbox="924 253 1468 309" data-label="Text"><p>H is a proper subgroup of G if H is a subgroup, and $H \subset G$</p></div>
