

<div>DEFINITION</div> <div>Subset</div>	<div>Notation: <math>A \subseteq B</math>, informally <math>A \subset B</math></div> <div>if <math>x \in A</math>, then <math>x \in B</math></div>
<div>DEFINITION</div> <div>Proper Subet</div>	<div>Notation: <math>A \subset B</math></div> <div><math>A \subseteq B</math> and <math>A \neq B</math></div>
<div>DEFINITION</div> <div>Union</div>	<div>Notation: <math>A \cup B</math></div> <div><math>\{x \mid x \in A \text{ or } x \in B\}</math></div>
<div>DEFINITION</div> <div>Intersection</div>	<div>Notation: <math>A \cap B</math></div> <div><math>\{x \mid x \in A \text{ and } x \in B\}</math></div>

<div>DEFINITION</div> <div>Disjoint Sets</div>	<div>A and B are disjoint if <math>A \cap B = \emptyset</math></div>
<div>DEFINITION</div> <div>Equal Sets</div>	<div>A and B are equivalent if <math>A \subset B</math> and <math>B \subset A</math></div>
<div>DEFINITION</div> <div>Complement</div>	<div>For any set <math>A \subset U</math></div> <div><math>A' = \{x \in U \mid x \notin A\}</math></div>
<div>DEFINITION</div> <div>Difference</div>	<div><math>A \setminus B = A \cap B'</math></div>

<div>DEFINITION</div> <div>Cartesian Product</div>	<div> <math display="block">A \times B = \{(a, b) \mid a \in A \text{ and } b \in B\}</math> </div>
<div>DEFINITION</div> <div>Relation</div>	<div> <p>A relation from A to B is a subset of <math>A \times B</math></p> </div>
<div>DEFINITION</div> <div>Function or Map</div>	<div> <p>Notation: <math>f : A \rightarrow B</math>, where A is the <i>domain</i> and B is the <i>target</i></p> <p>A relation from A to B where <math>\forall a \in A, \exists! (a, b)</math></p> <p><math>f(a) = b</math> means <math>(a, b) \in f</math></p> </div>
<div>DEFINITION</div> <div>Image of Function</div>	<div> <math display="block">f(A) = \{f(a) : a \in A\}</math> <p>Note: <math>f(A) \subset B</math></p> </div>

<div>DEFINITION</div> <div> <i>Surjective</i> </div>	<div>Also known as <i>onto</i></div> <div>A function <math>f : A \rightarrow B</math> for which <math>f(A) = B</math></div>
<div>DEFINITION</div> <div> <i>Injective</i> </div>	<div>Also known as <i>one-to-one</i></div> <div>A function <math>f : A \rightarrow B</math> for which <math>f(a_1) = f(a_2)</math> implies <math>a_1 = a_2</math></div>
<div>DEFINITION</div> <div> <i>Bijjective</i> </div>	<div>A function which is both injective and surjective.</div>
<div>DEFINITION</div> <div> <i>Composition</i> </div>	<div>For <math>f : A \rightarrow B</math> and <math>g : B \rightarrow C</math> , the composition <math>g \circ f</math> is defined as:</div> <div><math>(g \circ f)(x) = g(f(x))</math></div> <div>Notes: <math>g \circ f : A \rightarrow C</math>, and composition is associative</div>

<div>DEFINITION</div> <div>Composition Properties</div>	<ul style="list-style-type: none"> <li>• If g and f are surjective, <math>g \circ f</math> is surjective</li> <li>• If g and f are injective, <math>g \circ f</math> is injective</li> <li>• If g and f are bijective, <math>g \circ f</math> is bijective</li> </ul>
<div>DEFINITION</div> <div>Identity Map</div>	<div>Notation: <math>id_s</math></div> <div><math>id(x) = x, id : S \rightarrow S</math></div> <div>Note: <math>id_s = \{(x, x) : x \in S\}</math></div>
<div>DEFINITION</div> <div>Inverse</div>	<div>Notation: <math>f^{-1}</math></div> <div><math>g = f^{-1} \iff g \circ f = id_A</math></div> <div><math>f</math> is invertible means it has an inverse.</div> <div><math>f</math> is invertible iff it's bijective.</div>
<div>DEFINITION</div> <div>Partition</div>	<div>Let X be a set. P is a partition of X means:</div> <div><math>P = \{p_i \subset X \mid P \neq \emptyset\}</math>, all <math>p_i</math> are disjoint, and the union of all <math>p_i</math> is P.</div>

### DEFINITION

### Equivalence Relation

Relation R of X with these properties:

- Reflexive:  $\forall x \in X, (x, x) \in R$
- Symmetric:  $(x, y) \in R \implies (y, x) \in R$
- Transitive:  $(x, y), (y, z) \in R \implies (x, z) \in R$

$$x \sim y \text{ means } (x, y) \in R$$

### DEFINITION

### Equivalence Class

$$[x] = \{y \in X \mid y \sim x\}$$

Two equivalence classes are either disjoint or equal.

### DEFINITION

### Divisibility

Notation:  $b \mid a$  (b divides a)

$$a = bk \text{ for some } k \in \mathbb{Z}$$

### DEFINITION

## Congruence

Let  $r, s \in \mathbb{Z}$  and  $n \in \mathbb{N}$ .

Notation:  $r \equiv_n s$

$$n \mid (r - s)$$

Note:  $\equiv_n$  is an equivalence relation of  $\mathbb{Z}$

<div>DEFINITION</div> <div> <i>Properties of Congruence</i> </div>	<ul style="list-style-type: none"> <li>• <math>a + b \equiv b + a \quad ab \equiv ba</math></li> <li>• <math>(a + b) + c \equiv a + (b + c) \quad (ab)c \equiv a(bc)</math></li> <li>• <math>a + 0 \equiv a \quad a1 \equiv a</math></li> <li>• Multiplication distributes over addition</li> <li>• <math>\exists b \in \mathbb{Z} \mid a + b \equiv 0</math></li> <li>• Let <math>a \in \mathbb{Z}, a \neq 0</math>  <math>\gcd(a, n) = 1 \iff \exists b \in \mathbb{Z} \mid ab \equiv_n 1</math></li> </ul>
<div>DEFINITION</div> <div> <i>Mathematical Induction</i> </div>	<div>Let <math>S(n)</math> be a statement about <math>n \in \mathbb{N}</math></div> <div>           If <math>S(n_0)</math> is true for some <math>n_0 \in \mathbb{N}</math>, and  <math>S(k) \implies S(k + 1)</math>, then <math>S(n)</math> is true for all  <math>n \geq n_0</math> </div>
<div>DEFINITION</div> <div> <i>Strong Mathematical Induction</i> </div>	<div>Let <math>S(n)</math> be a statement about <math>n \in \mathbb{N}</math></div> <div>           If <math>S(n_0)</math> is true for some <math>n_0 \in \mathbb{N}</math>, and  <math>S(n_0), S(n_0 + 1), S(n_0 + 2) \dots S(k) \implies S(k + 1)</math>,            then <math>S(n)</math> is true for all <math>n \geq n_0</math> </div>
<div>DEFINITION</div> <div> <i>Well-Ordered</i> </div>	<div>A non-empty subset of <math>\mathbb{Z}</math> which contains a least element.</div>

<div>DEFINITION</div> <div>Well-Ordering Principle</div>	<div>Every non-empty subset of <math>\mathbb{N}</math> is well-ordered.</div>
<div>DEFINITION</div> <div>Division Algorithm</div>	<div>Let <math>a, b \in \mathbb{Z}</math> and <math>b &gt; 0</math></div> <div><math>\exists! q, r \in \mathbb{Z} \mid a = qb + r</math> and <math>0 \leq r &lt; b</math></div>
<div>DEFINITION</div> <div>Common Divisor</div>	<div>Let <math>a, b, d \in \mathbb{Z}</math></div> <div><math>d</math> is a common divisor of <math>a</math> and <math>b</math> means that <math>d \mid a</math> and <math>d \mid b</math></div>
<div>DEFINITION</div> <div>Greatest Common Divisor</div>	<div>Notation: <math>\gcd(a, b)</math> where <math>a, b \in \mathbb{Z}</math></div> <div>Note: If <math>a, b &gt; 0</math>, <math>\exists r, s \in \mathbb{Z} \mid \gcd(a, b) = ar + bs</math></div>

<div>DEFINITION</div> <div>Relatively Prime</div>	<div><math>\gcd(a,b) = 1</math></div>
<div>DEFINITION</div> <div>Prime</div>	<div>p is prime if only numbers that divide it are 1 and p</div> <div>Otherwise, p is <i>composite</i></div>
<div>DEFINITION</div> <div>Prime Number Properties</div>	<div><math>p \mid ab \implies p \mid a \text{ or } p \mid b</math></div> <div>There exists an infinite number of primes.</div>
<div>DEFINITION</div> <div>Fundamental Theorem of Arithmetic</div>	<div>Let <math>n \in \mathbb{N}, n &gt; 1</math></div> <div><math>n = p_1 p_2 p_3 \dots p_k</math> where <math>p_i</math> are prime</div> <div>This factorization is unique.</div>

<div>DEFINITION</div> <div>Binary Operation</div>	<div>A function <math>f : S \times S \rightarrow S</math> on a set S</div> <div><math>f(a, b)</math> is denoted by <math>a \circ b</math> or <math>ab</math></div>
<div>DEFINITION</div> <div>Group</div>	<div>Notation: <math>(S, \circ)</math> for operation <math>\circ</math> on set S</div> <div>Properties:</div> <ul style="list-style-type: none"> <li>• Associative: <math>(ab)c = a(bc)</math></li> <li>• Identity Exists: <math>\exists e \in S \mid ai = a = ia, \forall a \in S</math></li> <li>• Inverses Exist: <math>\forall a \in S, \exists b \in S \mid ab = e = be</math></li> </ul>
<div>DEFINITION</div> <div>Group Properties</div>	<div>The inverses are unique for each element.</div> <div><math>(ab)^{-1} = a^{-1}b^{-1}</math></div>
<div>DEFINITION</div> <div>Commutative/Abelian Group</div>	<div>A group for which <math>ab = ba \ \forall a, b \in S</math></div>

<div>DEFINITION</div> <div>Finite Group</div>	<div> <math>(G, \circ)</math> is a finite group if <math>G</math> is a finite set. </div> <div>Otherwise, it's an infinite group.</div>
<div>DEFINITION</div> <div>Group Order</div>	<div>The order of finite group <math>(G, \circ)</math> is <math> G </math>.</div> <div>The order of an infinite group is <math>\infty</math>.</div>
<div>DEFINITION</div> <div>Quaternion Group</div>	<div> <math>(Q_8, \circ)</math> where <math>Q_8 = \{\pm 1, \pm i, \pm j, \pm k\}</math> and: </div> <div> <ul style="list-style-type: none"> <li><math>i^2 = j^2 = k^2 = -1</math></li> <li>1 is identity</li> <li>-1 commutes everything</li> <li><math>ij = k, jk = i, ki = j</math></li> <li><math>ik = -j, kj = -i, ji = -k</math></li> </ul> </div>
<div>DEFINITION</div> <div>Matrix Group</div>	<div> <math>M_2(\mathbb{R})</math> is multiplicative group for all 2x2 real number matrices. </div> <div>Non-abelian group.</div>

<div>DEFINITION</div> <div>General Linear Group</div>	<div><math>GL_2(\mathbb{R})</math> is subset of <math>M_2(\mathbb{R})</math> where every matrix is invertible.</div> <div>Non-abelian group.</div>
<div>DEFINITION</div> <div>Multiplicative Group Exponents</div>	<div> <ul style="list-style-type: none"> <li><math>g^n = g \circ g \circ g \circ g \cdots \mid n \geq 1</math></li> <li><math>g^0 = e</math></li> <li><math>g^{-1} = g^{-1} \circ g^{-1} \circ g^{-1} \cdots \mid n &lt; 0</math></li> <li><math>g^m g^n = g^{m+n}, (g^m)^n = g^{mn}</math></li> <li><math>(gh)^n = (h^{-1} g^{-1})^{-n}</math> If group is abelian, then <math>(gh)^n = g^n h^n</math></li> </ul> </div>
<div>DEFINITION</div> <div>Additive Group Exponents</div>	<div> <ul style="list-style-type: none"> <li><math>ng = g + g + g \cdots \mid n \geq 0</math></li> <li><math>-ng = -g + -g + -g \cdots \mid n &lt; 0</math></li> </ul> </div> <div>If group is abelian, then <math>m(g + h) = mg + mh</math></div>
<div>DEFINITION</div> <div>Group Cancellation Laws</div>	<div>If G is a group, and <math>a, b, c \in G</math>, then:</div> <div><math>ba = bc \implies a = c</math> (left cancellation)</div> <div><math>ab = cb \implies a = c</math> (right cancellation)</div>

<div>DEFINITION</div> <div>Subgroup</div>	<div>           A group <math>(H, \circ)</math> is a subgroup of <math>(G, \circ)</math> if <math>H \subseteq G</math> and if H also forms a group under the operation <math>\circ</math>. This is true iff:         </div> <div> <ul style="list-style-type: none"> <li>Identity <math>e \in G</math> is in H</li> <li><math>h_1, h_2 \in H \implies h_1 \circ h_2 \in H</math></li> <li><math>h_1 \in H \implies h_1^{-1} \in H</math></li> </ul> </div>
<div>DEFINITION</div> <div>Subgroup Alternative Criteria</div>	<div>Let <math>H \subseteq G</math>. H is a subgroup of G iff:</div> <div> <ul style="list-style-type: none"> <li><math>H \neq \emptyset</math></li> <li><math>a, b \in H \implies a \circ b^{-1} \in H</math></li> </ul> </div>
<div>DEFINITION</div> <div>Trivial Subgroup</div>	<div><math>\{e\}</math></div>
<div>DEFINITION</div> <div>Proper Subgroup</div>	<div>           H is a proper subgroup of G if H is a subgroup, and <math>H \subset G</math> </div>

<div>DEFINITION</div> <div>Cyclic Subgroup</div>	<div> <math>\langle g \rangle</math> is the cyclic subgroup of <math>G</math> generated by <math>g \in G</math> </div> <div> <math>\langle g \rangle = \{g^n \mid n \in \mathbb{Z}\}</math> </div> <div> <math>g</math> is the generator of <math>\langle g \rangle</math> </div> <div> <math>\langle g \rangle</math> is the smallest subgroup of <math>G</math> containing <math>g</math> </div>
<div>DEFINITION</div> <div>Order of Generator</div>	<div> Order <math> g </math> is the smallest <math>n \in \mathbb{N} \mid g^n = e</math> </div> <div> If none exist, <math> g  = \infty</math> </div>
<div>DEFINITION</div> <div>Cyclic Group</div>	<div> <math>G</math> is a cyclic group if <math>\exists g \in G \mid G = \langle g \rangle</math> </div>
<div>DEFINITION</div> <div>Cyclic Group Properties</div>	<div> Every cyclic group is abelian. </div> <div> Let <math>G = \langle x \rangle</math>, <math>x^k = e \iff n \mid k</math> </div> <div> Every subgroup of a cyclic group is cyclic. </div> <div> For cyclic group <math>G</math> of order <math>n</math>, and <math>a</math> generating <math>\langle a \rangle</math>, <math>b = a^k \implies  b  = \frac{n}{\gcd(k,n)}</math> </div>

<div>DEFINITION</div> <div>Finite Cyclic Group in <math>\mathbb{Z}</math></div>	<div>Let <math>Z_n = \{0, 1, 2, 3, 4, \dots, n - 1\}</math></div> <div><math>(Z_n, +)</math> is an abelian group such that:</div> <div><math>a + b = c</math> where <math>a + b \equiv_n c</math></div>
<div>DEFINITION</div> <div>Group of Units</div>	<div><math>U_n = \{m \mid 1 \leq m &lt; n, \gcd(m, n) = 1\}</math></div>
<div>DEFINITION</div> <div>Permutation</div>	<div>A permutation of a set X is a bijective map <math>f : X \rightarrow X</math></div> <div>Notation:</div> <div><math>\begin{pmatrix} A &amp; B &amp; C \\ B &amp; A &amp; C \end{pmatrix}</math></div>
<div>DEFINITION</div> <div>Symmetric Group</div>	<div>All permutations of a set X.</div> <div><math>S_n</math> (or <math>S_X</math>) for set X or order n.</div> <div>Binary operation is function composition.</div> <div>Note: <math> S_n  = n!</math></div>

<div>DEFINITION</div> <div> <i>Permutation Group</i> </div>	<div>Subgroup of a symmetric group.</div> <div>Not usually abelian.</div>
<div>DEFINITION</div> <div> <i>Cycle</i> </div>	<div>           A permutation <math>p \in S_X</math> such that  <math>\exists a_1 a_2 a_3 \dots a_n \in X</math> and:           <div> <math>p(a_1) = a_2</math>  <math>p(a_2) = a_3</math>  <math>\dots</math>  <math>p(a_n) = a_1</math> </div>           Notation: <math>(a_1 a_2 a_3 \dots a_n)</math> for an <math>n</math>-cycle         </div>
<div>DEFINITION</div> <div> <i>Disjoint Cycles</i> </div>	<div>Two cycles <math>(a_1 a_2 a_3 \dots a_n)</math> and <math>(b_1 b_2 b_3 \dots b_m)</math> are disjoint if <math>a_j \neq b_k</math> for all <math>j \in [1, n]</math> and <math>k \in [1, m]</math>.</div>
<div>DEFINITION</div> <div> <i>Transposition</i> </div>	<div>A cycle of length 2</div>

<div>DEFINITION</div> <div>Cycles Properties</div>	<div>Every permutation in <math>S_n</math> can be written as a product of disjoint cycles.</div> <div>The product of disjoint cycles cannot be simplified to smaller disjoint cycles.</div> <div>Disjoint cycles are commutative.</div> <div>Every cycle can be written as the product of transpositions.</div>
